APPENDICES

A: List of Projects in the 2009 TIP Amendment #09-06

B: List of Projects in the Transportation 2035 Plan

C: Travel Forecasting Assumptions

LIST OF TABLES

1: VOC and NOx Emissions Budgets from 2001 Ozone Attainment Plan

2: Vehicle Activity Forecasts

3A: Emission Budget Comparisons for Ozone Precursors

3B: Emission Budget Comparisons for Carbon Monoxide

4: Emissions Reductions for Transportation Control Measures (TCMs) A – E

5: Transportation Control Measures (TCMs) in the State Implementation Plan

6: Federal Transportation Control Measures for Ozone (TCMs A – E)

I. INTRODUCTION

The Metropolitan Transportation Commission (MTC) prepares a transportation air quality conformity analysis when MTC amends or updates its long-range regional transportation plan (RTP), or adds or deletes regionally significant, non-exempt projects into the Transportation Improvement Program (TIP).

The purpose of this conformity analysis is to conform the proposed Transportation 2035 Plan and proposed amendment to the 2009 Transportation Improvement Program (herein referred to as the 2009 TIP Amendment #09-06) in accordance with the latest U.S. EPA transportation conformity regulations and the Bay Area Conformity State Implementation Plan (Conformity SIP), which is also known as the Bay Area Air Quality Conformity Protocol (MTC Resolution No. 3757).

This report explains the basis for the conformity analysis and provides the results used by MTC to make a positive conformity finding on the Transportation 2035 Plan and 2009 Transportation Improvement Program (up through TIP Amendment #09-06).

Purpose of Conformity Analysis

The 1990 Clean Air Act Amendments (CAAA) outlines requirements for ensuring that federal transportation plans, programs and projects are consistent with (“conform to”) the purpose of the State Implementation Plan (SIP). Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant national ambient air quality standards. A conformity finding demonstrates that the total emissions projected for a RTP or TIP are within the emissions limits (“budgets”) established by the SIP, and that transportation control measures (TCMs) are implemented in a timely fashion.

Conformity applies to areas that are designated non-attainment, and those redesignated to attainment after 1990 (“maintenance areas” with plans developed under Clean Air Act section 175A) for ozone, particulate matter, carbon monoxide, and nitrogen oxide. The U.S. EPA published conformity regulations to implement the 1990 CAAA conformity requirements in November 1993, and revised them in August 1995, November 1995, August 1997, July 2004, and May 2005.

Metropolitan Planning Organizations such as MTC are required to adopt and follow these regulations. In the Bay Area, the procedures were first adopted in September 1994 to comply with the 1990 CAAA. Four subsequent amendments to the transportation conformity procedures in August 1995, November 1995, August 1997, and July 2006 have been adopted by the three co-lead agencies (MTC, Association of Bay Area Governments (ABAG), and Bay Area Air Quality Management District (BAAQMD)). MTC Resolution 3757 represents the latest San Francisco Bay Area Transportation Air Quality Conformity Protocol adopted by the three agencies in July 2006. Acting on behalf of the three agencies, the BAAQMD

submitted this latest Protocol to California Air Resources Board (CARB) as a revision to the Bay Area Conformity SIP. CARB approved this proposed revision to the Bay Area's Conformity SIP in December 2006, and transmitted it to U.S. EPA for final action. U.S. EPA approved the Bay Area Conformity SIP in December 2007 (40 CFR Part 42).

These regulations and resolutions state in part that, MTC cannot approve any transportation plan, program or project unless these activities conform to the purpose of the federal air quality plan (officially titled the State Implementation Plan, or SIP). "Transportation plan" refers to the RTP. "Program" refers to the TIP, which is a financially realistic set of highway and transit projects to be funded over the next four years. A "transportation project" is any highway or transit improvement, which is included in the RTP and TIP and requires funding or approval from the Federal Highway Administration or the Federal Transit Administration. Conformity regulations also affect regionally significant non-federally funded projects which must be included in a conforming transportation plan and program.

Status of Regional Transportation Plan

A Regional Transportation Plan, or RTP, is a long-range plan which includes both long-range and short-range strategies/actions that lead to the development of an integrated multimodal transportation system to facilitate the safe and efficient movement of people and goods in addressing current and future transportation demand. By federal law, the RTP covers a minimum planning horizon of 20 years and be updated every four years in areas which do not meet federal air quality standards. The RTP is financially constrained to the projected transportation revenues that will be reasonably available to the region over the planning period. Once adopted, the RTP guides the development of the TIP for the region.

The latest conforming RTP is the Transportation 2035 Plan, which was adopted by the Commission in February 2005 (MTC Resolution 3681). The Federal Highway Administration and Federal Transit Administration approved MTC's conformity determination for the Transportation 2030 Plan on March 17, 2005. The Transportation 2035 Plan was subsequently amended on May 23, 2007 (MTC Resolution No. 3804) and on December 19, 2007 via an administrative modification.

The proposed Transportation 2035 Plan is the 2009 update to the current Transportation 2030 Plan. This conformity analysis serves to conform the Transportation 2035 Plan.

The proposed Transportation 2035 Plan was prepared by MTC in partnership with the Association of Bay Area Governments (ABAG), Bay Area Air Quality Management District (BAAQMD), and Bay Conservation and Development Commission (BCDC) and in collaboration with federal and state agencies, Caltrans, nine county-level Congestion Management Agencies (CMAs), over two dozen Bay Area transit operators, and numerous transportation stakeholders and the public. The proposed Transportation 2035 Plan represents the transportation policy and action statement of how the Bay Area will approach the region's transportation needs through the 2035 planning horizon year. The proposed

Transportation 2035 Plan is financially constrained – meaning its funds for investments match with revenues projected to be reasonably available to the region over the next 25 years. The proposed Transportation 2035 Plan features a set of highway, transit, local roadway, bicycle and pedestrian projects identified through regional and local transportation planning process.

Refer to **Appendix B** for detailed project listing of projects/programs included in the proposed Transportation 2035 Plan. See MTC’s Draft Transportation 2035 Plan (December 2009) for full details about the plan.

Status of Transportation Improvement Program

The federally required Transportation Improvement Program, or TIP, is a comprehensive listing of Bay Area surface transportation projects that receive federal funds or are subject to a federally required action, or are considered regionally significant for air quality conformity purposes. MTC prepares and adopts the TIP every two years. The TIP must cover at least a four-year period and contain a priority list of projects grouped by year. The TIP is also financially constrained – meaning that the amount of funding programmed does not exceed the amount of funding reasonably expected to be available. Adoption of the TIP must be accompanied by an air quality conformity analysis and finding, and all projects included in the TIP must be derived from and/or be consistent with the RTP. Whenever a new RTP is adopted, a new air quality conformity analysis must be prepared for the TIP, to ensure consistency between the current Plan (RTP) and Program (TIP).

The latest conforming TIP is the 2009 TIP adopted by the Commission on May 28, 2008 (MTC Resolution No. 3875), and approved by the Federal Highway Administration (FHWA) and Federal Transit Administration on November 17, 2008. The current 2009 TIP covers the four-year period from FY 2008-09 through FY 2011-12, and contains approximately 1,100 projects totaling about \$13 billion dollars.

MTC has prepared Amendment #09-06 to the 2009 TIP to conform the 2009 TIP to the Transportation 2035 Plan for air quality conformity purposes. This amendment adds new sales tax projects, reconciles State Transportation Improvement Program (STIP) projects, and adds or deletes other exempt and non-exempt projects consistent with the new RTP (T-2035). This conformity analysis serves to re-conform the entire 2009 TIP.

Refer to **Appendix A** for detailed project listing of projects/programs in the 2009 TIP Amendment #09-06. Note that specific funding sources are identified in the TIP amendment itself. See MTC’s Draft 2009 Transportation Improvement Program Amendment #09-06 (December 2008) for full details about the TIP.

II. BAY AREA AIR POLLUTANT DESIGNATIONS

National 1-Hour Ozone Standard

On November 6, 1991, the U.S. Environmental Protection Agency (EPA) designated the Bay Area as a moderate ozone non-attainment area. Based on “clean” air monitoring data from 1990 to 1993, the co-lead agencies—BAAQMD, MTC, and ABAG—determined that no ozone violations had occurred and requested the California Air Resources Board (ARB) to forward a redesignation request and an ozone maintenance plan to U.S. EPA.

On May 25, 1995, the Bay Area was classified as an ozone maintenance area, having attained the 1-hour national ozone standard for five years (1990-1994). However, on July 10, 1998 the U.S. EPA published a Notice of Final Rulemaking redesignating the Bay Area back to an ozone non-attainment (unclassified) area. This action was due to violations of the 1-hour standard that occurred during the summers of 1995 and 1996, and became final on August 10, 1998.

On October 31, 2003, U.S. EPA proposed a finding of attainment of the national 1-hour ozone standard for the Bay Area. The proposed finding was based on air quality monitoring data from the 2001, 2002, and 2003 ozone seasons. In April 2004, U.S. EPA made a final finding that the Bay Area had attained the national 1-hour ozone standard. Because of this finding, some of the elements of the 2001 Ozone Attainment Plan, submitted to EPA to demonstrate attainment of the 1-hour standard, were suspended. The finding of attainment did not mean the Bay Area had been reclassified as an attainment area for the 1-hour standard. To be reclassified, the region would have had to submit a formal redesignation request to EPA, along with a maintenance plan showing how the region would continue to attain the standard for ten years. However, this redesignation request was no longer necessary upon the establishment of the new national 8-hour ozone standard.

On April 15, 2004, EPA issued the first phase of the final implementation rule designating and classifying areas not meeting the federal 8-hour ozone standard. This phase of the implementation rule explained how EPA was classifying areas not meeting the national air quality standard for 8-hour ozone. It also established a process for transitioning from implementing the 1-hour standard for ozone to implementing the more protective 8-hour ozone standard. The rule also established attainment dates for the 8-hour standard and the timing of emissions reductions needed for attainment. The 8-hour designations and classifications took effect on June 15, 2004; and one year following this effective date, EPA revoked the 1-hour standard.

National 8-Hour Ozone Standard

In July 1997, U.S. EPA revised the ozone standard, setting it to 0.08 parts per million in concentration-based form, specifically the 3-year average of the annual 4th highest daily maximum 8-hour ozone concentrations. In April 2004, EPA issued final designations for attainment and non-attainment areas. The Bay Area monitoring stations recorded concentrations that exceeded the national 8-hour ozone standard for 2001, 2002 and 2003. In June 2004, EPA formally designated the Bay Area as a non-attainment area for national 8-hour ozone, and classified the region as “marginal” based on five classes of non-attainment areas for ozone, ranging from marginal to extreme. Marginal, non-attainment areas must attain the national 8-hour ozone standard by June 15, 2007.

On July 1, 2004, EPA published a final rule amending the transportation conformity rule to address the new national 8-hour ozone standard. The amended rule stated that Plans and TIPs in nonattainment areas must be found to conform against the new standard by one year after the effective date of designation – by June 15, 2005 for 8-hour ozone areas. Conformity for the 1-hour ozone standard will no longer apply in existing 1-hour ozone nonattainment and maintenance areas once the 1-hour ozone standard is revoked; this occurred on June 15, 2005. Furthermore, prior to 8-hour budgets being established, all areas with adequate or approved 1-hour motor vehicle emission budgets must use them to demonstrate conformity with the 8-hour ozone standard, unless it is determined through interagency consultation that using the interim emissions tests is more appropriate. The conformity finding in this report is based on the approved 1-hour motor vehicle emissions budget.

In March 2008, EPA lowered the national 8-hour ozone standard from 0.80 parts per million to 0.75 parts per million. State recommendations for area designations are due March 2009, and EPA will make final area designations by March 2010.

National 8-Hour Carbon Monoxide Standard

In April 1998, the Bay Area was redesignated to a “maintenance area” for the national 8-hour carbon monoxide (CO) standard, having demonstrated attainment of the standards. As a maintenance area, the region must assure continued attainment of the CO standard.

Approved Motor Vehicle Emissions Budgets

The Bay Area has conformity requirements for both the federal ozone and CO standards. Under these requirements, the Bay Area has to meet a motor vehicle emission “budget” test for Volatile Organic Compounds (VOC), Nitrogen Oxides (NO_x) and CO. To make a positive conformity finding, MTC must demonstrate that the calculated motor vehicle emissions in the region are lower than the approved budgets. As mentioned above, under EPA’s conformity rule for the national 8-hour ozone standard, the existing 1-hour motor vehicle emission budget is to be used for conformity analyses until it is replaced by another budget.

For the ozone precursor emissions VOC and NO_x, the applicable motor vehicle emissions budget was developed for the 2006 attainment year as part of the 2001 Ozone Attainment Plan and was subsequently approved by EPA.

For CO, the applicable motor vehicle emissions budget was developed for the 2004 Revisions to the California State Implementation Plan for Carbon Monoxide (herein referred to as the 2004 Carbon Monoxide Maintenance Plan).

The motor vehicle emission budgets are listed below:

VOC:	164 tons per day (2006 and beyond)
NO _x :	270.3 tons per day (2006 and beyond)
CO:	1,850 tons per day (2003 and beyond)

On road motor vehicle emissions are analyzed for various analysis years that must not be more than 10 years apart, or more than 10 years from the base year used to validate the model (2000). For this conformity analysis, the analysis years are 2015, 2025, and 2035 for VOC and NO_x. MTC has prepared separate travel forecasts for the Bay Area for each of these years. For CO, the analysis years are 2015, 2018, 2025, and 2035. Travel forecast data for year 2018 were interpolated between 2015 and 2025. These travel forecasts are then used to calculate motor vehicle emissions.

III. CONFORMITY ANALYSIS & RESULTS

Approach to Conformity Analysis

MTC has used the latest planning assumptions for the purpose of preparing this conformity analysis. Regional on-road motor vehicle emissions for future years are estimated using MTC's travel demand forecast model (BAYCAST 2000), which estimates vehicle activity in the Bay Area, in conjunction with the ARB's latest model for determining motor vehicle emissions (EMFAC2007, Version 2.3).

The MTC travel demand model requires various inputs – demographic assumptions, pricing assumptions, travel behavior assumptions and highway and transit network assumptions. This conformity analysis uses the latest socio-economic/land use forecast series *Projections 2007* developed and adopted by ABAG and the latest validated version of the MTC travel demand model (BAYCAST 2000).

In addition, pricing assumptions include projected parking prices, gasoline and non-gasoline auto operating costs, fuel economy, bridge tolls, and transit fares. Travel behavior assumptions include trip peaking factors, vehicle occupancy factors, and estimates of interregional commuters. Highway and transit networks were updated for each analysis year to reflect investments in the proposed Transportation 2035 Plan (see Appendix B) and 2009 TIP Amendment #09-06 (see Appendix A).

Regional VMT and engine starts (which are needed for emission calculations) are forecasted using a combination of output from MTC's travel demand forecasting model and base year (2000) VMT information provided by the ARB. For conformity purposes, MTC agreed to follow ARB's protocol for estimating VMT.

Refer to **Appendix C** for detailed travel and air quality modeling assumptions used in this conformity analysis.

Consultation Process

MTC has consulted on the preparation of this conformity analysis and other conformity related issues with the Bay Area's Air Quality Conformity Task Force. The Conformity Task Force is composed of representatives of U.S. EPA, ARB, FHWA, FTA, Caltrans, MTC, BAAQMD, ABAG, the nine county Congestion Management Agencies, and Bay Area transit operators. The Conformity Task Force reviews the assumptions going into the analysis, consults on TCM implementation issues, and reviews the results of the conformity analysis. The task force meetings are open to the public and are regularly attended by interested members of the public. Topics covered in past meetings of the Air Quality Conformity Task Force include the following:

June 2008

- Transportation 2035 Update
- Approach, Assumptions, and Schedule for the Conformity Analysis for the Transportation 2035 Plan and 2009 Transportation Improvement Program Amendment #09-06
- Air Quality Updates

December 2008

- Administrative Draft Conformity Analysis for the Transportation 2035 and 2007 Transportation Improvement Program Amendment #09-06
- Interagency Consultation Requirements for PM_{2.5} HOT Spot Analysis
- Overview of ABAG's Projections 2009
- Air Quality Updates

February 2009 (Upcoming)

- Response to Comments & Proposed Final Conformity Analysis for the Transportation 2035 and 2007 Transportation Improvement Program Amendment #09-06
- Air Quality Updates

Comparison of Motor Vehicle Emissions To Budgets

As explained earlier, motor vehicle emissions budgets are established in the SIP for VOCs, NO_x and carbon monoxide (CO). To make a positive conformity finding, the regional motor

vehicle emissions must be equal to or less than these budgets. The results of the vehicle activity forecasts and motor vehicle emission calculations are shown below for each separate analysis year. For VOC and NO_x, the motor vehicle emission budget also reflects anticipated emission reductions from five Transportation Control Measures (TCMs) incorporated in the 2001 Ozone Attainment Plan (Table 1).

**TABLE 1
 VOC AND NO_x EMISSIONS BUDGETS FROM 2001 OZONE ATTAINMENT PLAN (TONS/DAY)**

VOC	
2006 On Road Motor Vehicle Emissions	168.5
2006 Mobile Source Control Measure Benefits	(4.0)
2006 TCM Benefits	(0.5)
2006 Emissions Budget	164.0
NO_x	
2006 On Road Motor Vehicle Emissions	271.0
2006 TCM Benefits	(0.7)
2006 Emissions Budget	270.3

**TABLE 2
 VEHICLE ACTIVITY FORECASTS**

	2015	2025	2035
VEHICLES IN USE	5,457,800	6,102,453	6,693,633
Daily VMT (1000s)	173,560	191,718	209,785
Engine Starts	36,181,142	40,134,461	43,911,799

Carbon Monoxide Maintenance Plan Budget

The budget for carbon monoxide is derived from the 2004 Carbon Monoxide Maintenance Plan. The emission budget for the Bay Area is 1,850 tons per day. This budget applies to all subsequent analysis years as required by federal conformity regulation, including: any interim year conformity analyses, the 2018 horizon year, and years beyond 2018.

Comparison of Estimated Regional Motor Vehicle Emissions to the Budget

The motor vehicle activity forecasts for the Transportation 2035 Plan and 2009 TIP Amendment #09-06 for the various horizon years are converted to motor vehicle emission estimates by MTC using EMFAC2007.

Table 3A and 3B compares the results of the various analyses with the applicable budgets. The analyses indicate that the motor vehicle emissions are substantially below the budget, due in large part to recent improvements in ARB’s latest EMFAC model which reflect the effects of cleaner vehicles in the California fleet and the enhanced Smog Check program now in effect in the Bay Area. With respect to the new Maintenance Plan motor vehicle emission budget for CO, Table 3B shows that calculated motor vehicle emissions will be well below the new budget of 1,850 tons per day in 2018 as well.

The estimated effectiveness of the various Transportation Control Measures, given their current implementation status is shown in Table 4. TCMs A through E are fully implemented. They have achieved the required cumulative total emission reductions of 0.5 tons per day of VOC and 0.7 tons per day of NO_x by 2006.

**TABLE 3A
 EMISSIONS BUDGET COMPARISONS FOR OZONE PRECUSORS
 (TONS/DAY)**

Year	VOC Budget*	On-Road Motor Vehicles VOC	TCMs**	Net Emissions
2015	164.0	72.54	(0.3)	72.24
2025	164.0	49.06	(0.3)	48.76
2035	164.0	37.21	(0.3)	36.91

Year	NO _x Budget*	On-Road Motor Vehicles NO _x	TCMs**	Net Emissions
2015	270.3	108.39	(0.5)	107.89
2025	270.3	59.58	(0.5)	59.08
2035	270.3	42.83	(0.5)	42.33

**2001 Ozone Attainment Plan*

***The transit services for TCM A Regional Express Bus Program were modeled. The emission benefits from TCM A are therefore included in the On-Road Motor Vehicles VOC and NO_x emission inventories for 2006 and beyond.*

2025	1,850	348.89
2035	1,850	268.72

**2004 Revision to the California State Implementation Plan for Carbon Monoxide, Updated Maintenance Plan for 10 Federal Planning Areas*

***Estimated CO emissions for 2018 is extrapolated from the 2015 and 2025 analysis years.*

**TABLE 4
EMISSIONS REDUCTIONS FOR TRANSPORTATION CONTROL MEASURES (TCMS) A – E IN
STATE IMPLEMENTATION PLAN THROUGH DECEMBER 2006 (TONS PER DAY)**

TCM	VOC Emission Reductions through December 2006	NO _x Emission Reductions through December 2006
TCM A Regional Express Bus Program	0.20	0.20
TCM B Bicycle/Pedestrian Program	0.04	0.03
TCM C Transportation for Livable Communities	0.08	0.12
TCM D Expansion of Freeway Service Patrol	0.10	0.25
TCM E Transit Access to Airports	0.09	0.13
Total Reductions	0.5	0.7

IV. TRANSPORTATION CONTROL MEASURES

History of Transportation Control Measures

Transportation control measures (TCMs) are strategies to reduce vehicle emissions. They include such strategies as improved transit service and transit coordination, ridesharing services and new carpool lanes, signal timing, freeway incident management, increased gas taxes and bridge tolls to encourage use of alternative modes, etc. The original set of TCMs plus the five new TCMs (A-E) have been fully implemented. The TCMs were added over successive revisions to the SIP (see Table 5). For more information on TCMs 1-28, which are completed, see the *Transportation Air Quality Conformity Analysis for the 2001 Regional Transportation Plan and FY 2001 Transportation Improvement Program Amendment 01-32 (February 2002)*. This report can be found in the MTC/ABAG Library.

- Twelve (12) ozone measures were originally listed in the 1982 Bay Area Air Quality Plan.
- In response to a 1990 lawsuit in the federal District Court, sixteen (16) additional TCMs were subsequently adopted by MTC in February 1990 as contingency measures to bring the region back on the “Reasonable Further Progress” (RFP) line. The Federal District order issued on May 11, 1992, found that these contingency TCMs were sufficient to bring the region back on the RFP track anticipated in the SIP. These measures became part of the SIP when U.S. EPA approved the 1994 Ozone Maintenance Plan.
- Two (2) transportation control measures from the 1982 Bay Area Air Quality Plan apply to Carbon Monoxide control strategies, for which the region is in attainment with the federal standard, and primarily targeted downtown San Jose (which had the

most significant CO problem at that time.) MTC also adopted a set of TCM enhancements in November 1991 to eliminate a shortfall in regional carbon monoxide emissions identified in the District Court's April 19, 1991 order. Carbon monoxide standards have been achieved primarily through the use of oxygenated/reformulated fuels in cars and with improvements in the Smog Check program.

- As part of EPA's partial approval/partial disapproval of the 1999 Ozone Attainment Plan, four (4) TCMs were deleted from the ozone plan (but two of these remain in the Carbon Monoxide Maintenance Plan).
- Five (5) new Transportation Control Measures were adopted as part of the new 2001 1-Hour Ozone Attainment Plan and are fully funded in the TIP and 2001 Regional Transportation Plan.

With respect to TCM 2 from the 1982 SIP, there has been a protracted debate, leading to a citizens lawsuit in federal court, about the obligations associated with this TCM. On April 6, 2004 MTC prevailed in the U.S. Court of Appeals for the Ninth Circuit which concluded that TCM 2 does not impose any additional enforceable obligation on MTC to increase ridership on public transit ridership by 15% over 1982-83 levels by November 2006 (*Bayview Hunters Point Community Advocates v. Metropolitan Transportation Com'n*, (2004 WL 728247, 4 Cal. Daily Op. Serv. 2919, 2004 Daily Journal D.A.R. 4209, 9th Cir.(Cal.), Apr 06, 2004)). Thus TCM 2 has been resolved, and there are no further implementation issues to address in this TCM.

**TABLE 5
Transportation Control Measures (TCMs) in the State Implementation Plan**

<i>TCM</i>	<i>Description</i>
<i>Original TCMs from 1982 Bay Area Air Quality Plan</i>	
TCM 1	Reaffirm Commitment to 28 percent Transit Ridership Increase Between 1978 and 1983
TCM 2	Support Post-1983 Improvements in the Operators' Five-Year Plans and, After Consultation with the Operators, Adopt Ridership Increase Target for the Period 1983 through 1987
TCM 3	Seek to Expand and Improve Public Transit Beyond Committed Levels
TCM 4	High Occupancy Vehicle (HOV) Lanes and Ramp Metering
TCM 5	Support RIDES Efforts
TCM 6*	Continue Efforts to Obtain Funding to Support Long Range Transit Improvements
TCM 7	Preferential Parking
TCM 8	Shared Use Park and Ride Lots
TCM 9	Expand Commute Alternatives Program
TCM 10	Information Program for Local Governments
TCM 11**	Gasoline Conservation Awareness Program (GasCAP)
TCM 12**	Santa Clara County Commuter Transportation Program
<i>Contingency Plan TCMs Adopted by MTC in February 1990 (MTC Resolution 2131)</i>	
TCM 13	Increase Bridge Tolls to \$1.00 on All Bridges
TCM 14	Bay Bridge Surcharge of \$1.00
TCM 15	Increase State Gas Tax by 9 Cents
TCM 16*	Implement MTC Resolution 1876, Revised — New Rail Starts
TCM 17	Continue Post-Earthquake Transit Services
TCM 18	Sacramento-Bay Area Amtrak Service
TCM 19	Upgrade Caltrain Service
TCM 20	Regional HOV System Plan
TCM 21	Regional Transit Coordination
TCM 22	Expand Regional Transit Connection Ticket Distribution
TCM 23	Employer Audits
TCM 24	Expand Signal Timing Program to New Cities
TCM 25	Maintain Existing Signal Timing Programs
TCM 26	Incident Management on Bay Area Freeways
TCM 27	Update MTC Guidance on Development of Local TSM Programs
TCM 28	Local Transportation Systems Management (TSM) Initiatives
<i>New TCMs in 2001 Ozone Attainment Plan</i>	
TCM A	Regional Express Bus Program
TCM B	Bicycle/Pedestrian Program
TCM C	Transportation for Livable Communities
TCM D	Expansion of Freeway Service Patrol
TCM E	Transit Access to Airports

*Deleted by EPA action from ozone plan

**Deleted by EPA action from ozone plan, but retained in Carbon Monoxide Maintenance Plan.

Source: Bay Area Air Quality Management District, Metropolitan Transportation Commission, 2001.

Status of Transportation Control Measures

TCMs A-E were approved into the SIP as part of EPA's Finding of Attainment for the San Francisco Bay Area (April 2004). The conformity analysis must demonstrate that TCMs are being implemented on schedule (40 CFR 93.113). TCMs A-E have specific implementation steps which are used to determine progress in advancing these TCMs (see Table 6). TCMs A-E are now fully implemented.

**TABLE 6
 IMPLEMENTATION STATUS OF FEDERAL TRANSPORTATION CONTROL MEASURES FOR OZONE (TCMS A – E)**

#	TCM	Description	Ozone Attainment Plan Implementation Schedule	Implementation Status
A	Regional Express Bus Program	Program includes purchase of approximately 90 low emission buses to operate new or enhanced express bus services. Buses will meet all applicable ARB standards, and will include particulate traps or filters. MTC will approve \$40 million in funding to various transit operators for bus acquisition. Program assumes transit operators can sustain service for a five year period. Actual emission reductions will be determined based on routes selected by MTC.	FY 2003. Complete once \$40 million in funding pursuant to Government Code Section 14556.40 is approved by the California Transportation Commission and obligated by bus operators	\$40 million for this program was allocated by the CTC in august, 2001. The participating transit operators have ordered and received a total of 94 buses. Four of the initial proposed projects no longer appear viable; the buses ordered for these will be redeployed in alternate services. All buses were operational by 2006. TCM A is fully implemented.
B	Bicycle / Pedestrian Program	Fund high priority projects in countywide plans consistent with TDA funding availability. MTC would fund only projects that are exempt from CEQA, have no significant environmental impacts, or adequately mitigate any adverse environmental impacts. Actual emission reductions will be determined based on the projects funded.	FY 2004 – 2006. Complete once \$15 million in TDA Article 3 is allocated by MTC.	MTC allocated over \$20 million in TDA Article 3 funds during FY2004, FY2005, and FY2006. TCM B is fully implemented.

*ADMIN DRAFT Transportation-Air Quality Conformity Analysis
Transportation 2035 Plan and 2009 Transportation Improvement Program Amendment#09-06*

#	TCM	Description	Ozone Attainment Plan Implementation Schedule	Implementation Status
C	Transportation for Livable Communities (TLC)	Program provides planning grants, technical assistance, and capital grants to help cities and nonprofit agencies link transportation projects with community plans. MTC would fund only projects that are exempt from CEQA, have no significant environmental impacts, or adequately mitigate any adverse environmental impacts. Actual emission reductions will be based on the projects funded.	FY 2004 – 2006. Complete once \$27 million in TLC grant funding is approved by MTC	In December 2003, the Commission reaffirmed its commitment of \$27 million annually over 25 years for the TLC program as part of Phase 1 of the Transportation 2030 Plan. MTC and the county Congestion Management Agencies (CMAs) have approved over \$27 million in TLC grant funding by FY 2006. In November 2004, MTC approved \$500,000 for regional TLC Community Design Planning Program, and in December 2004, MTC approved \$18.4 million in TLC funding for the regional TLC Capital program. As of December 2006, CMAs in Alameda, Marin and Sonoma counties approved an additional \$12.4 million in their county-level TLC Capital programs for a regional total of \$31.2 million. TCM C is fully implemented.
D	Additional Freeway Service Patrol	Operation of 55 lane miles of new roving tow truck patrols beyond routes which existed in 2000. TCM commitment would be satisfied by any combination for routes adding 55 miles. Tow trucks used in service are new vehicles meeting all applicable ARB standards.	FY 2001. Complete by maintaining increase in FSP mileage through December 2006	FSP continues to maintain the operation of the 55 lane miles of new roving tow truck coverage. This level of service was maintained through 2006. FSP continues to expand its service areas. TCM D is fully implemented.
E	Transit Access to Airports	Take credit for emission reductions from air passengers who use BART to SFO, as these reductions are not included in the Baseline.	BART – SFO service to start in FY 2003. Complete by maintaining service through December 2006	Service began June, 2003. Service adjustments were made in September, 2004 to improve productivity and to increase the number of peak period trains stopping at the Airport station. Service was maintained through 2006 and is continued. TCM E is fully implemented.

V. RESPONSE TO PUBLIC COMMENTS

MTC's Planning Committee released the Draft Conformity Analysis for a 30-day public review period from January 9, 2009 to February 9, 2009. Response to public comments will be included in the final report.

VI. CONFORMITY FINDINGS

Based on the analysis, the following conformity findings are made:

- This conformity assessment was conducted consistent with EPA's conformity regulations and with the Bay Area Air Quality Conformity Procedures adopted by MTC as Resolution No. 3757.
- The proposed Transportation 2035 Plan and 2009 Transportation Improvement Program Amendment #09-06 provide for implementation of TCMs pursuant to the following federal regulation:
 - (1) *An examination of the specific steps and funding source(s) needed to fully implement each TCM indicates that TCMs which are eligible for funding under title 23 U.S.C. or the Federal Transit Laws are on or ahead of the schedule established in the applicable implementation plan, or, if such TCMs are behind the schedule established in the applicable implementation plan, the MPO and DOT have determined that past obstacles to implementation of the TCMs have been identified and have been or are being overcome, and that all State and local agencies with influence over approvals or funding for TCMs are given maximum priority to approval or funding to TCMs over other projects within their control, including projects in locations outside the non-attainment or maintenance area.*
 - (2) *If TCMs in the applicable implementation plan have previously been programmed for Federal funding but the funds have not been obligated and the TCMs are behind the schedule in the implementation plan, then the TIP cannot be found to conform if the funds intended for those TCMs are reallocated to projects in the TIP other than TCMs, or if there are no other TCMs in the TIP, if the funds are reallocated to projects in the TIP other than projects which are eligible for Federal funding intended for air quality improvements projects, e.g., the Congestion Mitigation and Air Quality Improvement Program.*
 - (3) *Nothing in the TIP may interfere with the implementation of any TCM in the applicable implementation plan. (40 CFR Part 93.113(c)).*
- For carbon monoxide, motor vehicle emissions in the proposed Transportation 2035 Plan and 2009 Transportation Improvement Program Amendment #09-06 are lower than the transportation conformity budget in the SIP.
- For Volatile Organic Compounds (VOC) and Nitrogen Oxides (NO_x), motor vehicle emissions in the proposed Transportation 2035 Plan and 2009 Transportation Improvement Program Amendment #09-06 are also lower than the applicable motor vehicle emission budgets for the national 8-hour ozone standard.

Appendix C
Travel Forecast Assumptions for the
Transportation 2035 Plan and 2009 TIP Amendment #09-06

Travel Forecasting Assumptions for Conformity Analysis of Transportation 2035 Plan and 2009 Transportation Improvement Program/Amendment # 09-06

This report documents the travel forecasting assumptions for the 2009 Regional Transportation Plan (RTP), and includes the following analysis years: 2006, 2015, 2025, and 2035. The analysis is based on the “latest planning assumptions” as documented below. In addition, the current conformity analysis also uses the latest upgrades to the MTC travel demand forecast model, which was updated and re-validated to a 2006 base year in Spring 2008.

The vehicle travel forecasts from the MTC travel demand model are then used in conjunction with the California Air Resource Board’s (ARB) motor vehicle emission model (EMFAC2007) to estimate total regional on road motor vehicle emissions.

In preparing these travel forecasts, MTC uses four basic sets of assumptions:

- Pricing Assumptions;
- Travel Behavior Assumptions;
- Demographic Assumptions; and
- Highway and Transit Network Assumptions.

Demographic and detailed highway and transit network definition assumptions are not included in this appendix. The RTP travel forecasts are based on the socio-economic/land use forecast series *Projections 2007*, developed by the Association of Bay Area Governments (ABAG). These projections reflect the new regional “Smart Growth” land use assumptions and have been approved for use in the conformity analysis by the US DOT and EPA, subject to periodic preparation of a monitoring report by ABAG to examine results and review assumptions used in the projections. The projections also reflect the near term effects of the current economic slowdown on job creation in the Bay Area.

Pricing assumptions include projected parking prices; gasoline and non-gasoline auto operating costs; fuel economy; bridge tolls; and transit fares.

Travel behavior assumptions include trip peaking factors, vehicle occupancy factors, and estimates of interregional commuters.

Additional travel forecasting methodology issues are addressed in this report. These are special methodological issues related to air quality and mobile source emissions inventories. The methodology issues include:

- Commercial Vehicle Methodology;
- Speed Post-Processing Methodology;
- Distribution of VMT by Speed Methodology; and
- Adjustment of Regional VMT and Trips.

I. Pricing Assumptions

A. Parking Costs (Table 1)

The MTC demand models were estimated using nominal, or posted parking prices as opposed to actual parking prices. Actual parking prices would be the average parking price paid by a consumer, weighted by those who are subsidized by their employer and those who are not subsidized by their employer. For peak period parking cost, the monthly posted parking price is divided by 22 days per month to derive an average workday parking cost. The average workday parking cost is then divided by 8 hours to derive an average peak hour parking cost per hour in 1990 cents. In the home-based work mode choice model application, the per hour charge is multiplied by 8 hours, then divided by 2, to derive a per vehicle trip charge. Next, the per vehicle trip charge is divided by the vehicle occupancy so that parking costs are equally distributed between vehicle drivers and passengers.

Estimates for the years 2000 and 2035 peak hour and off-peak per hour parking costs are shown in Table 1. Data is shown for only the travel analysis zones with non-zero parking costs. This table also shows the change in net employment density, and the estimate of average monthly commuter parking costs, in 2008 current dollars.

The off-peak parking costs (per hour) are generally higher than the peak parking costs (per hour) since the peak parking costs are based on the discounted monthly parking rates, divided by 22 work days per month, divided by 8 hours per workday. The off-peak parking costs are reflective of mid-day, regular, not discounted parking costs.

The MTC assumption for parking costs is that they will change, in real terms, by the ratio of the net total employment density in the target year to the net employment density in the base year (2000).

MTC staff periodically inventory parking garages throughout the Bay Area to monitor trends in parking prices. The most recent update to this inventory was conducted fall 2000.

Auto Operating Costs (Table 2, 3, Figures 1, 2)

The MTC travel demand models are based on non-linear auto operating costs which vary according to trip speed and distance. As speed increases, the fuel consumption rate (gallons per mile) decreases linearly. As distance increases, the share of “cold start” fuel consumption decreases. This internal model is used to derive trip-specific fuel economy (miles per gallon) which is multiplied by the per gallon gas price to derive per trip gasoline operating cost. A constant non-gasoline operating cost per mile is multiplied by trip distance to get per trip non-gas cost. Total auto operating cost per trip is the sum of the gasoline cost per trip plus the non-gasoline cost per trip plus any bridge tolls or parking charges. Details on the auto operating cost model are included in the BAYCAST Users Guide (August 2004).

The MTC auto operating cost model is based on work conducted by Cambridge Systematics, Inc., as part of the *Urban Transportation Energy Conservation* study, published in 1978 (known as “UTEC”). The UTEC models were also used to derive auto operating costs for the Southern California Association of Governments’ current set of travel demand models.

The basic inputs to the BAYCAST model system, in terms of auto operating cost, are gasoline price (in 1990 constant dollars); the fuel correction factor (to represent fleet turnover and more fuel efficient vehicles); and the non-gasoline operating cost (in 1990 cents per mile.) Data on historical, 1990 to 2008, and assumed future year auto operating costs are detailed in Table 3 and Figures 1 and 2.

This is the most challenging set of forecasting assumptions given the radical and recent escalation of gas prices over the 2008 calendar year. According to the AAA, late May 2008 gas prices range from \$4.18 per gallon of regular unleaded in the North Bay to \$4.23 in San Francisco. In the previous month (April 2008), gas prices ranged from \$3.90 per gallon in the North Bay to \$4.00 per gallon in San Francisco [<http://www.fuelgaugereport.com/CAMetro.asp>]. The United States Energy Information Administration (EIA) is showing national gas prices, for the week of 5/26/08, ranging from a low of \$3.83 per gallon in Texas to \$4.17 per gallon in Chicago, with a national average of \$3.94 per gallon. From May 2007 to May 2008, the average national gas price increased from \$3.21 per gallon to \$3.94 per gallon, a 23 percent increase in 12 months. [http://www.eia.doe.gov/oil_gas/petroleum/data_publications/wrgp/mogas_home_page.html]

To take into account recent gas price increases, MTC tested several linear regression models based on historical gas prices reported by the US Bureau of Labor Statistics (BLS). Data from April 1988 through April 2008 was used to produce various regression results, as shown in Table 2. Regressions based on 20 years of gas price data (1988-2008) would predict a \$4.14/gallon gas price by the year 2035 (in today’s dollars). The regression based on the past five years of gas price data (2003-2008) would extrapolate to \$11.02/gallon by the year 2035 (again, in today’s 2008 dollars).

MTC is using the 10-year regression model, based on published gas prices from April 1998 through April 2008, for the future year 2035 gas price (see Table 2 and Figure 1). This is \$7.47 per gallon in today's dollars. This is comparable to current European petrol prices, which range from \$4.70 per gallon in Estonia to \$8.43 per gallon in Norway. (The closest to this \$7.47 estimate is Germany, currently at \$7.64/gallon, or 1.37 euros/liter.)

Gas price assumptions were finalized in late May 2008. Subsequent gas price data, published by the US Bureau of Labor Statistics, show that Bay Area gas prices peaked in June 2008 (\$4.50/gallon), falling slightly to \$4.49 per gallon in July, and settling back to \$3.87 per gallon in September 2008 (see Figure 2).

The other major factor to consider in auto operating costs is the average fuel economy. MTC staff has estimated that the overall Bay Area fuel economy will increase from 19.86 miles per gallon in 2006 to 32.15 miles per gallon in 2035. This is based on MTC staff analysis of EMFAC2007 databases and models supplied by the California Air Resources Board (CARB), and takes into account the Pavley Phase I and Pavley Phase II regulations. MTC staff analysis shows that Pavley Phase I would increase Bay Area fuel economy to 27.91 mpg; and Pavley Phase II would further increase the overall fuel economy to 32.15 mpg. Note that these estimates are for light duty auto (LDA), small light duty trucks under 8,500 pounds (LDT1) and small light duty trucks over 8,500 pounds (LDT2).

The increase in overall fuel economy is a striking 59 percent increase between 2006 and 2035 (see Table 3). The increase in fuel economy is almost offset by the 76 percent real increase in gas price assumed between 2008 and 2035, such that the overall auto operating cost per mile is projected to increase by just 10 percent, from 20.9 cents/mile (2008\$) to 23.2 cents/mile (2008\$). This appears comparable to current European and Japanese-level gasoline prices and fuel economy.

The following table summarizes the horizon year auto operating cost assumptions used in MTC regional transportation planning activities over the past ten years. It is useful in showing the usefulness and need to re-evaluate latest planning assumptions on an ongoing basis.

Planning Study	Horizon Year	Fuel		
		Gas Price (4/08\$)	Economy (mpg)	Gas Price per Mile (4/08\$)
1998 RTP	2020	\$1.86	21.9	8.5 cents/mile
2001 RTP	2025	\$2.26	21.9	10.3
2005 RTP	2030	\$2.26	21.9	10.3
Vision 2035	2035	\$3.93	27.7	14.2
<i>Current, 2008</i>	2008	<i>\$4.20</i>	<i>20.1</i>	<i>20.9</i>
2009 RTP	2035	\$7.47	32.2	23.2

The other key assumption is that non-gasoline operating cost (maintenance and repair, motor oil, parts, accessories) is 40 percent of total auto operating costs. This 40 percent figure is based on US Bureau of Labor Statistics data on consumer expenditures (see Table 4 of the MTC report: *Consumer Price Indices: Bay Area & U.S. Cities: 1950-2001*.) In a typical household, between five and six percent of a household's expenditures are related to auto operating costs. Gasoline cost has fluctuated from 55.6 percent to 73.5 percent of total auto operating costs over the past twenty years.

Auto ownership costs, which now comprise around 7.3 percent of the average household's budget, are not used in determining trip running, or variable costs. Auto ownership costs includes the cost of new or used vehicle purchasing and financing, insurance premiums, and vehicle registration and licensing fees. These fixed costs of auto ownership are more important in determining the number and quality of vehicles to own or lease. Given the difficulty in projecting automobile quality and costs, household income is used as a surrogate in predicting auto ownership levels.

C. Bridge Tolls (Table 4, Figure 3)

Year 2008 bridge tolls are used for all future year forecasts. This means that tolls will increase with inflation, so that their real value is not eroded.

Bay Area voters approved Regional Measure 2 on the March 2, 2004 general election. This measure increased the toll on all Bay Area state-owned bridges from \$2.00 to \$3.00 as of July 1, 2004. Since 1998, drivers on all Bay Area state-owned bridges have paid a \$1 seismic surcharge to help finance a seismic retrofit program to strengthen and reinforce bridge structures and roadways on five of the bridges in the event of a major earthquake. On January 1, 2007 the seismic surcharge increased to \$2 per vehicle, resulting in the current, \$4.00 per passenger vehicle toll.

In previous conformity analyses, toll cost assumptions assumed no further increase in tolls, with the value of the toll decreasing, in real dollar terms, with an assumed inflation rate. For the 2009 Regional Transportation Plan, MTC is now assuming that tolls for Bay Area bridges will keep pace with inflation, similar to the standard assumption that transit fares will keep pace with inflation. Bay Area state-owned bridge tolls are assumed to remain at \$4.00 (in 2008 current dollars) for the duration of the long-range planning period (Table 4, Figure 3).

This means that tolls will increase to about \$4.89 per passenger vehicle in 2015, to \$6.50 per passenger vehicle by 2025, and to \$8.66 per passenger vehicle by 2035. These dollar values are in current dollar terms, and reflect a 2.9 percent per year annual inflation assumption.

For purposes of travel forecasting, the one-way toll is halved so that both directions on every bridge are allocated one-half of the total average toll. This is a technical necessity to counter the toll collection direction bias.

D. Transit Fares (Table 5, Figures 4.1, 4.2, 4.3)

Year 2008 transit fares are used for all future year forecasts. This means that fares will increase with inflation, so that their real value is not eroded. This assumption is borne out by past fare trends, and reflects the ongoing need for transit operators to periodically adjust their fares to keep up with increased labor costs, maintain their local contribution to capital replacement projects, and pay for increases in the cost of fuel and other supplies.

Changes in Bay Area transit operator fares, 1998 to 2008, are summarized in Table 5. Transit fares in place as of June 1, 2008 were used as the base assumption for all 2009 RTP forecasts.

Historical and projected base fares are charted in Figure 4.1 (Muni), Figure 4.2 (AC Transit), and Figure 4.3 (BART). These charts show base transit fares in current and 1990 constant dollars. The current dollar fares are based on a 2.9 percent per year increase in consumer price indices through the Plan forecast period.

II. Travel Behavior Assumptions

A. Vehicle Peaking Factors (Tables 6, 7)

A new methodology introduced in the 2009 Regional Transportation Plan is intended to produce better estimates of “congested” travel times and speeds by time period for an average weekday. Previous work focused on generating estimates of AM peak period congested travel times and speeds; and free-flow travel times and speeds. This new methodology produces consistent estimates of congestion and VMT for five time periods of the day.

The standard output of the travel demand modeling system is daily person trips by trip purpose and travel mode. The in-vehicle person trips are converted into daily vehicle driver trips using either simple factors (1.0 for drive alone trips; 2.0 for shared ride two-occupant trips; 3.5 for shared ride three-or-more-occupant trips), or using the “vehicle driver” mode that is the standard output in the non-home-based and school trip mode choice models.

Daily vehicle trips are then split into vehicle trips for five time periods:

- Early Morning (0000-0600 military time);
- AM Peak (0600-1000);
- Midday (1000-1500);
- PM Peak (1500-1900); and
- Evening (1900-2400).

Peaking factors by trip purpose by time-of-day are derived from the Year 2000 Bay Area Travel Survey (BATS2000). The base year peaking factors used in the 2000 and 2006 base year forecasts are summarized in Table 6. The column labeled “purpose/direction” provides details on the trip purpose (HBW is home-based work) and direction (e.g., H2W is the home-to-work, W2H is the work-to-home direction).

The BAYCAST system directly simulates the number of AM peak period home-to-work vehicle trips, derived from the home-to-work departure time choice model. This is basically a “peak spreading” model that will predict fewer trips in the peak period when congestion levels increase.

Previous applications of the MTC home-to-work departure time choice model show a 6.8 percent reduction in the share of home-to-work trips occurring in the AM peak period, comparing 2006 to earlier 2035 forecasts. This result was then applied to both the AM and the PM peak period factors, shown in Table 6, to derive the time-of-day factors for forecast years, summarized in Table 7. To compensate for the 6.8 percent reduction in the share of trips occurring in the AM and PM peak periods, the peaking factors for the early morning, midday, and evening periods were increased so that all trips would be accounted for on a daily basis.

B. Interregional Commuters

Assumptions about the number of interregional commuters is key in two respects: first, intraregional home-based work productions and attractions need to be adjusted to reflect in-commuting and out-commuting from and to Bay Area jobs and households; second, interregional vehicle trips are needed to augment the intraregional trips included in the standard BAYCAST travel demand models. Interregional trips were updated to reflect Census 2000 journey-to-work data and commuter sketch planning forecasts.

Interregional commuters are estimated by factoring the Census 2000 journey-to-work data file using a 46-by-46 matrix that comprises the 34 Bay Area superdistricts and the 12 Bay Area neighbor counties. These sketch planning commuter forecasts are prepared for the years 2010, 2020 and 2030 and interpolated and extrapolate for conformity analysis years. This is basically a “sketch planning” effort to complement the formal models used to predict intraregional personal and intraregional commercial travel.

III. Demographic Assumptions

MTC used ABAG’s Projections 2007 forecasts (adopted December 2006) for future year population and employment assumptions and for the geographic distributions of residents and jobs throughout the region.

For use in MTC's travel demand model, MTC combines and allocates ABAG's tract-level forecasts to MTC's 1454 regional travel analysis zone system for all years.

MTC summaries of the ABAG Projections 2007 databases, at the county and MTC 34 superdistrict level, are available on MTC's FTP site, at: <ftp://ftp.abag.ca.gov/pub/mtc/planning/ZoneData/Proj2007/>

IV. Transportation Network Assumptions

A major part of the RTP conformity analysis is the definition of highway, transit, and pedestrian/bicycle networks for various analysis years. These networks describe the supply of transportation capacity and various service characteristics that influence travel behavior.

Projects assumed in the transportation network for the various analysis years are listed in Appendices B of this conformity report.

Transit operator service levels have significantly changed between 2000 and 2008, due to the economic decline and the need to reduce service on some routes. The most extensive service level changes were to SamTrans and AC Transit District (Newark, Union City routes), Golden Gate and SCVTA.

V. Commercial Vehicle Methodology

The MTC BAYCAST commercial vehicle models are based on the truck trip generation models developed for Caltrans and Alameda County as part of the 1992 I-880 Intermodal Corridor Study; and truck trip distribution models documented in the 1996 report "Quick Response Freight Manual" produced by the US Department of Transportation (usable truck trip distribution models were not developed for the I-880 Intermodal Corridor Study).

These truck models are specifically limited to larger trucks of six-or-more tires. There are three sub-purposes to the MTC truck models: 1. "Small Trucks" (two-axle, six-tire vehicles); 2. "Medium Trucks" (three-axle vehicles); and 3. "Combination Trucks" (four-or-more axle vehicles).

Beginning in 2004, MTC has introduced a "very small, two-axle four-tire" commercial vehicle truck trip purpose. The "very small truck" trip model is borrowed from the Phoenix, Arizona MPO, as documented in the FHWA "Quick Response Freight Manual." Before 2004, these very small truck trips were indirectly estimated by increasing non-home-based vehicle trips.

The following sidebar summarizes the MTC BAYCAST truck trip generation and distribution models, including the very small truck trip models:

<p><u>Garage-Based Truck Trip Production Models</u> Two-Axle Truck Productions = $0.011 * MFGEMP + 0.014 * RETEMP + 0.0105 * SEREMP + 0.046 * OTHEMP$ Three-Axle Truck Productions = $0.0014 * MFGEMP + 0.00012 * RETEMP + 0.0037 * OTHEMP$ Four-+-Axle Truck Productions = $0.0044 * MFGEMP + 0.0027 * SEREMP + 0.0084 * OTHEMP$</p> <p><u>Garage-Based Truck Trip Attraction Models</u> Two-Axle Truck Attractions = $0.0234 * TOTEMP$ Three-Axle Truck Attractions = $0.0046 * TOTEMP$ Four-+-Axle Truck Attractions = $0.0136 * TOTEMP$</p> <p><u>Non-Garage-Based Truck Trip Production & Attraction Models</u> Two-Axle Truck Productions and Attractions = $0.0324 * TOTEMP$ Three-Axle Truck Productions and Attractions = $0.0039 * TOTEMP$ Four-+-Axle Truck Productions and Attractions = $0.0073 * TOTEMP$</p> <p><u>Very Small Truck Trip Production & Attraction Models</u> Productions = $0.251 * TOTHH + 1.110 * AGREMP + 0.938 * MFGEMP + 0.938 * TRDEMP + 0.888 * RETEMP + 0.437 * SEREMP + 0.663 * OTHEMP2$</p> <p>Where: MFGEMP = Manufacturing Employment RETEMP = Retail Employment SEREMP = Service Employment OTHEMP = Other Employment (Wholesale Trade, Agriculture/Mining, Other) AGREMP = Agricultural + mining Employment TRDEMP = Wholesale Trade Employment OTHEMP2 = Other Employment (Agriculture/Mining + Other) TOTEMP = Total Employment TOTHH = Total Households</p> <p><u>Truck Trip Distribution Models: Gravity Models based on AM Peak Period Travel Time</u> Two-Axle Truck Trip Distribution Friction Factor: $FF_{ij} = \exp(-0.08 * TT_{ij})$ Three-Axle Truck Trip Distribution Friction Factor: $FF_{ij} = \exp(-0.1 * TT_{ij})$ Four-+-Axle Truck Trip Distribution Friction Factor: $FF_{ij} = \exp(-0.03 * TT_{ij})$ Very Small Truck Trip Distribution Friction Factor: Built off of NHB trip distribution model</p>

In terms of mobile source emissions inventories, the MTC estimates of mobile source emissions are based on the “default” vehicle type and vehicle technology mix assumed by the California Air Resources Board (CARB) in their EMFAC/BURDEN model series. The CARB assumptions on vehicle type mix are based on the same Caltrans databases and truck counts as used by MTC in model validation, only adjusted by CARB staff to conform to the weight-based vehicle classes needed as input to the EMFAC emission factor models.

VI. Traffic Assignment Methodology (Table 8)

The MTC BAYCAST models were updated and re-validated to a 2006 base year in Spring 2008. A major part of this effort was the validation of traffic assignments to observed daily traffic volumes, and observed AM peak period traffic volumes and speeds on Bay Area freeways.

Previous conformity analyses required a speed post-processing methodology to correct for overly fast expressway and arterial speeds. This speed post-processing methodology has been eliminated in the forecasts from 2004 to the present, and replaced with a consistent set of speeds used in all model components. What was formerly the “post-processing” methodology is now the “main processing” methodology. This means that reduced free-flow arterial and expressway speeds that were only incorporated in a post-processing traffic assignment stage are now used throughout the MTC model system: as inputs to the trip distribution, mode choice, as well as traffic assignment stages.

The standard set of speed-flow models used in the MTC model system includes an MTC variation on the “BPR” curve, and application of the “Akçelik” speed-flow curve documented in previous MTC research. The “MTC Breakdown Curve” is used for freeways and freeway-to-freeway segments; the “Akçelik Curve” is used for expressways, collectors, freeway ramps, major arterials and metered ramps.

MTC assumptions of per lane capacity and free-flow speed are “lookup” tables based on facility type (freeway, major arterial, etc.) and area type (rural, suburban, etc.) Area types are based on “area density,”

a combined measure of population and employment density. Current and former sets of free-flow speeds are shown in Table 8.

The following box summarizes the MTC standard and post-processing set of speed-flow models.

MTC Standard & Post-Processing Set of Speed-Flow Models
<p>MTC Breakdown Curve (Freeways & Freeway-to-Freeway Facilities)</p> $t = t_o * (1 + 0.20 * ((x)/0.75)^6)$
<p>Akçelik Curve (All Other Facilities)</p> $t = t_o + \{0.25 * T * [(x-1) + ((x-1)^2 + (16 * J_a * L^2/T^2))^0.5]\}$
<p>where:</p> <p>t = average travel time per unit distance (hours/mile)</p> <p>t_o = free-flow travel time per unit distance (hours/mile)</p> <p>T = flow period, i.e., the time interval in hours during which an average arrival (demand) flow rate, v, persists</p> <p>Q = capacity</p> <p>x = the degree of saturation, i.e., v/Q</p> <p>J_a = the delay parameter (Expressway = 0.2, Collector=1.2, Freeway Ramp=0.17, Major Arterial=0.4, Metered Ramp=0.2)</p> <p>J_a = the delay parameter (Post-Processing = calculated for each facility type, area type combination, where: J_a = (T_c - T_o)² / L² and "T_c" is the critical speed at V/C ratio of 1.0)</p> <p>L = Link length (miles)</p>

Significant changes to traffic assignment methodology from previous conformity analyses include the following two improvements:

1. Traffic assignment equilibration “convergence criteria” was tightened up as a result of the project level performance analyses. Traditional MTC traffic assignment practice has been to use the “default closure convergence criteria” included in the MTC network software package (Cube/Voyager), which is “GAP=0.005.” After discussions with other professionals, and extensive testing, MTC staff converted to a more stringent “relative gap” closure criteria, with a “RELGAP=0.001”. This results in about a 3 percent decrease in peak period vehicle hours of delay. More information is available in an April 2008, MTC powerpoint presentation: “The Urge to Converge: Minding the Gap in Voyager Traffic Assignment” (April 2008).
2. Peak spreading assumptions were used in new procedures for time-of-day-based, daily traffic assignments. Traditional MTC daily traffic assignment practice (before 2008) was to assign AM and PM peak period trips to an “all-or-nothing” basis on congested AM travel times; and all of the off-peak period trips, on an “all-or-nothing” basis, to free flow travel times, to derive average daily traffic volumes on the regional networks. MTC replaced this approach with a set of daily traffic assignments, using an equilibrium traffic assignment methodology, for five time periods: early morning (0000-0600 military time); AM peak period (0600-1000); midday (1000-1500); PM peak period (1500-1900); and evening (1900-2400). This means that we have “congested” speeds for all five time periods of the average weekday. In addition to this improvement, we used information from the MTC home-to-work time-of-day choice model, which shows that the share of regional home-to-work trips occurring in the two-hour AM peak period is projected to decrease by 6.8 percent between 2006 and 2035. We used this 6.8 percent decrease to downwardly adjust the share of vehicle trips occurring in both the AM and the PM peak periods, and to upwardly adjust the share of vehicle trips occurring in the three “off-peak” periods. This is a significant change which tends to “flatten the peak periods” for the AM and PM peak period traffic assignments, and to show increased congestion in other time periods, mostly the midday and evening periods.

VII. Adjustment of Regional VMT and Trips Methodology

Regional VMT and engine starts (needed for emission calculations) are forecasted using a combination of output from MTC’s travel demand forecasting model and base year (1999) VMT information provided by the California Air Resources Board (ARB). The ARB base year VMT comes from the State Bureau of Automotive Repair’s (BAR) biennial inspection/maintenance odometer records for registered Bay Area

vehicles. MTC then “grows” this VMT consistent with the growth in VMT projected in MTC’s regional travel model forecasts.

The BAR-based VMT will over-estimate Bay Area VMT by including Bay Area-registered vehicle travel occurring outside the nine-county region. The BAR-based VMT method will also not include Bay Area VMT by non-resident vehicular travel occurring inside the nine-county region. ARB considers that these anomalies offset each other, and that the resulting regional VMT level is a conservatively high value. In comparison, MTC estimates 140,116 thousand VMT per weekday in year 2000. The 1999 ARB estimates, based on BAR inspection/maintenance data, shows 157,359 thousand VMT per weekday.

For conformity purposes, MTC agreed to follow ARB’s protocol for estimating VMT. Using MTC growth estimation data, the 1999 ARB VMT estimate was adjusted to establish a new 2000 ARB baseline VMT estimate for mobile source emission inventory calculations in the Bay Area. MTC calculated that the ARB estimated VMT in year 2000 is 164,073. For comparative purposes, below is a table showing the differences in MTC and ARB’s VMT estimates from the 2001 RTP and 2007 TIP. These year 2000 estimates have not been updated for the 2009 RTP.

Base Year 2000, Average Weekday Daily VMT

	2001 RTP	2007 TIP
ARB	159,642*	164,073
MTC	134, 256	140,116
% Difference	-16%	-15%

*Source: San Francisco Bay Area-EMFAC2000

MTC used the 2000 ARB baseline VMT of 164,073 to develop VMT estimates for the remaining analysis years – 2006, 2007, 2015, 2025, and 2035. Annual compounded growth rates were then updated and applied to generate regional VMT totals for this conformity analysis.

Regional VMT Growth Rates for the 2009 RTP Conformity Analysis

Analysis Year Time Frame	MTC Model VMT	Percent Change	Annual Growth Rate
2000-2006	2006 = 144,985	3.47%	0.6%
2006-2015	2015 = 158,374	9.23%	1.0%
2015-2025	2025 = 174,843	10.40%	1.0%
2025-2035	2035 = 191,456	9.50%	0.9%

Regional engine starts (which generate event-specific emissions) are based on ARB’s estimate of approximately 6.72 to 6.75 engine starts per vehicle per day. This 6.75 engine starts per day value is based on a small-scale survey of instrumented Sacramento-area vehicles conducted by ARB. This contrasts to other Bay Area, California and National surveys that show trip rates ranging from 2.5 to 3.5 vehicle trips per vehicle per day. For more discussion on this engine starts per vehicle issue, refer to the November 24, 1999 letter from the MTC to the California Air Resources Board. ARB and MTC have also agreed to continue working on this issue.

VIII. Distribution of VMT by Speed Methodology (Table 9-12)

An important input to ARB’s EMFAC 2007 mobile source emissions inventory model are county-level files of the share of vehicle miles travel by speed cohort, by time of day. Data is produced for 13 speed cohorts and 5 time-of-day periods (0000-0600, 0600-1000, 0900-1500, 1500-1900 and 1900-2400). Regional average weekday daily totals of VMT by the 13 speed cohorts for 2006, 2015, and 2035 are summarized and charted in Table 9. These VMT values include intra-zonal VMT and terminal distance VMT. Regional average weekday VMT by time-of-day by the 13 speeds cohorts for 2006, 2015 and 2035 are also summarized and charted in Tables 10 through 12.

The first step in preparing the VMT-by-speed share file is the preparation of daily traffic assignments by the five time periods. The “loaded” daily highway network with congested speeds and volumes for the five time periods are then exported into text files and subsequently imported into SAS (Statistical Analysis System) for further post-processing. Daily assignment volumes are then multiplied by link distance to yield vehicle miles of travel (VMT) by link, which are in turn summarized at the county-of-occurrence by speed-cohort level by the five time periods of the day, and average weekday daily totals.

There are three components of regional VMT: interzonal VMT that is assigned to highway networks; intra-zonal VMT that is not assigned to highway networks; and terminal distance VMT that is not assigned to highway networks.

Intra-zonal vehicle trips are not assigned to highway networks. The VMT associated with intra-zonal vehicle trips is derived by exporting the intra-zonal vehicle trips and intra-zonal door-to-door distance data into a format compatible with SAS, and for merging with the daily traffic assignment SAS files. Intra-zonal VMT is approximately 7.2 to 7.5 percent of regional VMT in 2000 and in future years. SAS routines are then used to apply the “terminal distance” vehicle miles of travel to the inter-zonal and intra-zonal VMT. “Terminal distance” VMT is defined as the amount of travel from the “average household” or “average activity location” in a travel analysis zone to the nearest highway link represented in the regional highway networks.

These speed distributions were then applied to passenger cars (PC), light-duty trucks (T1, T2), medium-duty trucks (T3), and motorcycles (mcy) in EMFAC 2007. EMFAC2007 model defaults were used on all other vehicle types and times of day.

Table 2
Linear Regression on Bay Area Gas Prices, 1988-2008

Model #	Time Period	Duration	Model	Year 2035 Gas Price (4/08\$)
1	4/88 - 4/08	20 years	$y = 0.4431 x + 158.91$	\$4.14
2	4/90 - 4/08	18 years	$y = 0.5047 x + 166.33$	\$4.39
3	4/95 - 4/08	13 years	$y = 0.8906 x + 159.69$	\$5.87
4	4/98 - 4/08	10 years	$y = 1.3237 x + 158.91$	\$7.47
5	4/00 - 4/08	8 years	$y = 1.5456 x + 176.82$	\$8.26
6	4/03 - 4/08	5 years	$y = 2.3314 x + 206.76$	\$11.02

Highlighting indicates regression model selected

where:

x = months elapsed, relative to beginning of time period

y = future year gas price, in 4/2008 cents

Source data is average retail gasoline price in Bay Area, from US BLS.

- Costs are in 2008 current dollars

Inflation Assumption (2008 - 2035) = 2.90%

Notes:

1. Future non-gasoline operating cost based on assumption that it is 60% of auto gasoline cost.
2. Inflation assumption is based on compounded Bay Area inflation rate, 1990-2007 $(216.0/132.1)^{(1/17)} = 2.9\%/year$.
3. Future year estimates prepared 5/30/2008

WHEELS (LAVTA)	\$1.00	\$1.00	\$1.25	\$1.75	40.0%	8/1/2003	8/25/2007

Notes:

1. For the 1998 RTP, fares as of February 1998 were used. For the 2001 RTP, fares as of May 2001 were used.
 For the 2005 RTP/TIP, fares as of March 2004 were used.
2. Transit fares are from MTC records, and the Web site: <http://www.511.org/>
3. Caltrain fares are based on a 10-ride ticket book.
4. For the 2009 RTP, transit fares as of 6/1/2008 are used.
